

Single-Line Diagram — Meadowbank Solar + Storage

15 MW PV + 10 MW BESS shared 33 kV connection

PV array (15 MW) and BESS (10 MW / 20 MWh) are combined onto a common 33 kV switchboard sharing a single metered point of connection.

The BESS inverters are connected to the shared 33 kV AC bus through a bidirectional breaker. With the PV array offline, the BESS can charge from the grid through this path; there is no DC-coupling that would restrict charging to PV only.

A site controller enforces the combined 15 MW export limit.
